Study Guide and Solutions Manual

Organic Chemistry
A Brief Course

THIRTEENTH EDITION

David Hart
Ohio State University

Chris Hadad
Ohio State University

David Craine
Ohio State University

Harold Hart
Michigan State University

Prepared by

David Brown
Florida Gulf Coast University

BROOKS/COLE
CENGAGE Learning

Australia • Brazil • Japan • Korea • Mexico • Singapore • Spain • United Kingdom • United States

Contents

Introduction to the Student.....v

Chapter 1: Bonding and Isomerism 1

Chapter 2: Alkanes and Cycloalkanes; Conformational and Geometric Isomerism 18

Chapter 3: Alkenes and Alkynes.....34

Chapter 4: Aromatic Compounds 58

Chapter 5: Stereoisomerism 82

Chapter 6: Organic Halogen Compounds; Substitution and Elimination Reactions 102

Chapter 7: Alcohols, Phenols, and Thiols.....116

Chapter 8: Ethers and Epoxides.....134

Chapter 9: Aldehydes and Ketones.....149

Chapter 10: Carboxylic Acids and Their Derivatives.....175

Chapter 11: Amines and Related Nitrogen Compounds.....198

Chapter 12: Spectroscopy and Structure Determination.....219

Chapter 13: Heterocyclic Compounds 233

Chapter 14: Synthetic Polymers.....249

Chapter 15: Lipids and Detergents 263

Chapter 16: Carbohydrates 274

Chapter 17: Amino Acids, Peptides, and Proteins.....298

Chapter 18: Nucleotides and Nucleic Acids 326

Summary of Synthetic Methods.....341

Summary of Reaction Mechanisms 354

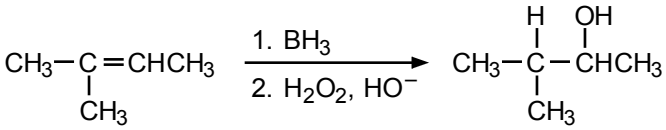

Review Problems On Synthesis 359

Sample Multiple Choice Questions 363

3.20

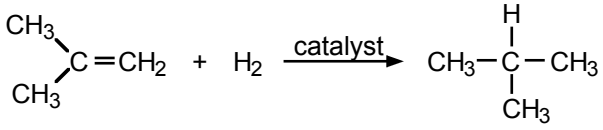

Acid-catalyzed hydration of vinylcyclohexane occurs in the Markovnikov sense:

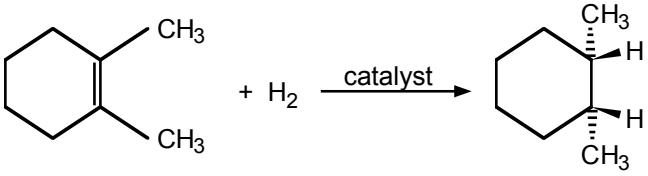

vinylcyclohexane

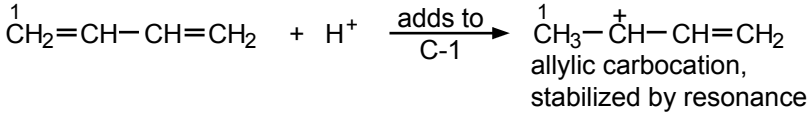

3.21 a.

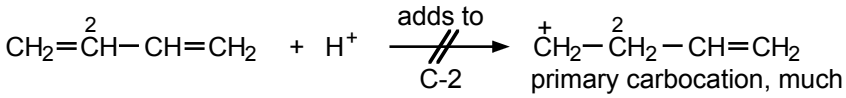

b.

3.22

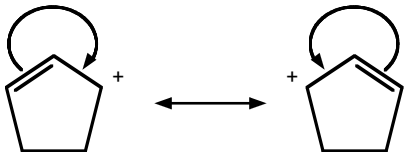

allylic carbocation, stabilized by resonance

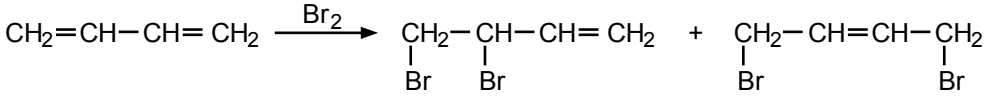

primary carbocation, much less stable than the allylic carbocation

3.23

3.24

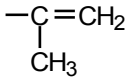

1,2-addition 1,4-addition

3.25 To find the structures of the diene and dienophile, break the cyclohexene ring just beyond the ring carbons that are connected to the double bond (the allylic carbons):

and the configuration is *S*. A word about the priority order may be helpful. The

group has three bonds from the attached carbon atom to the next atoms "out" and is therefore of the highest priority. The remaining groups both begin with $-CH_2$, so we must proceed further. One group is

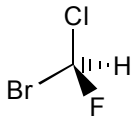

and the other is

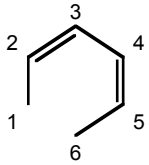

Of these, the group with C=O has the higher priority because oxygen has a higher atomic number than carbon.

5.38 The priority of the four groups is Br > Cl > F > H. The structure of the *R* enantiomer is:

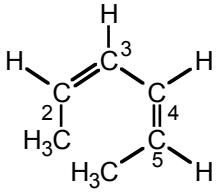

5.39 a.

(*Z*,*Z*)-2,4-hexadiene or more precisely, (2*Z*,4*Z*)-2,4-hexadiene

If you have difficulty, draw the full structure:

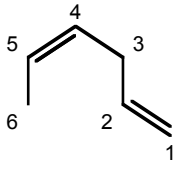

At the double bond between C-2 and C-3, the priority order is CH_3 > H and $CH_3CH{=}CH-$ > H. The two high-priority groups, CH_3 and $CH_3CH{=}CH-$, are *Z* or *zusammen*. The same is true at the double bond between C-4 and C-5.

b.

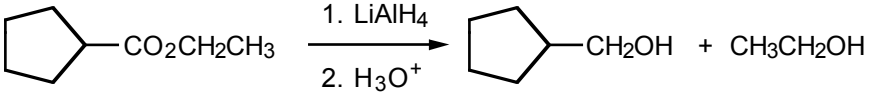

(*E*,*E*)-2,4-hexadiene

c.

10.55 Ketones are more reactive toward nucleophiles than esters. Reduction therefore occurs at the ketone carbonyl group, to give

$$CH_3CH(OH)CH_2CH_2CO_2CH_3$$

10.56 The method combines the formation of a cyanohydrin (Sec. 9.10) with the hydrolysis of a cyanide to an acid (Sec. 10.7d).

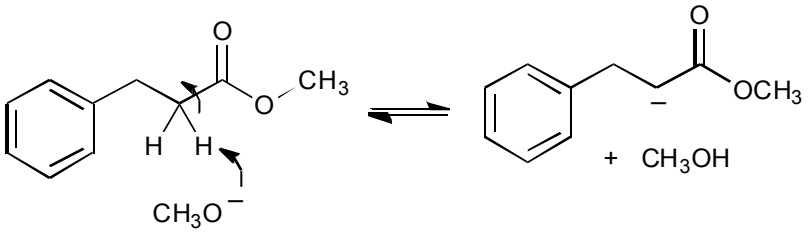

10.57 Use eqs. 10.48–10.50 as a guide. The overall equation is

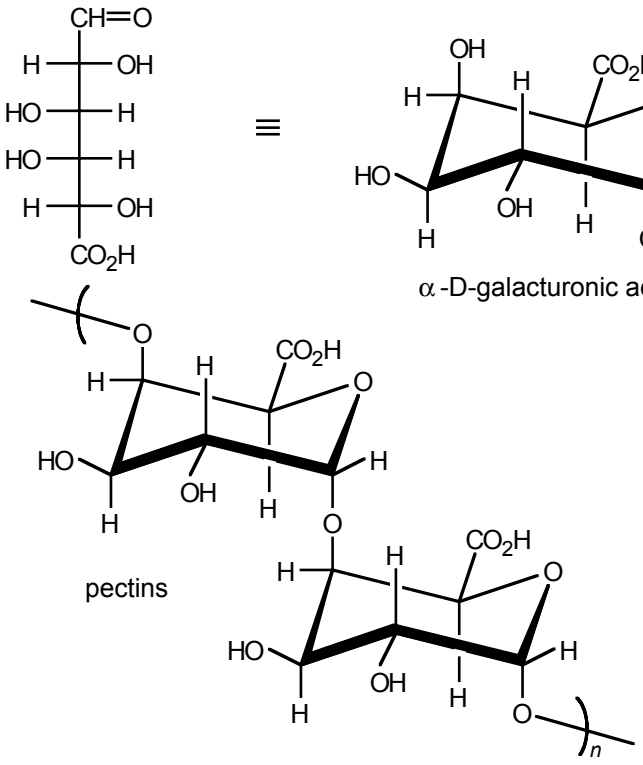

The steps are as follows:

Step 1:

16.45 The formula for β-D-xylopyranose, derived from the Fischer projection of D-xylose in Figure 16.1, is

Since the xylans have these units linked 1,4, their structure is

16.46 The anomeric carbon of the glucose unit on the "right" is in equilibrium with the corresponding aldehyde. This will be oxidized by the Br_2 to the corresponding acid. Subsequent treatment with aqueous acid will then hydrolyze the glycosidic bond.
